ALCOHOL: CORN GMO DECLARATION

MGP Ingredients, Inc.® (MGP) produces alcohol by the fermentation of and then the distillation of grains that are grown and are a renewable resource.

The principal raw material for most MGP Alcohol products is corn, which can be a genetically modified organism (GMO).

In the production of alcohol, the starch fraction of the grain is converted to fermentable sugar. The fermentable sugar is in turn converted to alcohol. Alcohol is further purified through distillations steps and does not contain any of the corn or other grain derivatives other than the alcohol. Based on the chemistry involved and as the grain components of alcohol are highly refined and processed, MGP does not conduct regular testing to demonstrate that the alcohol is “GMO free.” However, the testing that has been performed did not detect any bio-engineered organisms.
